</table>

**TABLE 1.2 NOTES:**

1. The planting dates listed are averages for each zone. These dates may require adjustment to reflect local conditions, especially near the boundaries of the zones. When seeding toward the end of the listed planting dates, or when conditions are expected to be less than optimal, add an appropriate nurse crop to permanent seeding mixes. Some legumes such as white/ladino and red clover can be seeded into cool-season grass stands using a frost seeding from January 15 to March 1. Success is dependent on receiving freeze-thaw cycles and adequate rainfall to germinate the legume seed.

2. Planting dates are approximate for locally harvested dormant cuttings that will be planted immediately. Dormant cuttings that are harvested and properly stored by commercial vendors can be planted during the spring and early summer, using the same dates as bare-root plants.

3. When planted during the growing season, most of these materials must be purchased and kept in a dormant condition until planting. Bare-root grasses are the exception—they may be supplied as growing (non-dormant) plants.

* In general, planting during the latter portion of this period allows more time for weed emergence and weed control prior to planting. When selecting a planting date, consider the need for weed control vs. the likelihood of having sufficient moisture for later plantings, especially on droughty sites.

♦ Additional planting dates during which supplemental watering may be needed to ensure plant establishment.

** Dormant season plantings of warm-season grasses — starting approximately 2 weeks after the first hard freeze (average date based on air temperature reading of 28 degrees F or lower, 50% probability of occurrence). Warm-season grasses need a soil temperature of at least 50 degrees F in order to germinate. If soil temperatures are colder than 50 degrees, or moisture is not adequate, the seeds will remain dormant until conditions are favorable. Recommend increasing the seeding rate by 25% to account for some loss of seed during the winter.

+ Frequent freezing and thawing of wet soils may result in frost-heaving of materials planted in late fall, if plants have not sufficiently rooted in place.
